Chaos theory - Wikipedia

A complex system is a system composed of many components which may interact with each other. Examples of complex systems are Earth's global climate, organisms, the human brain, infrastructure such as power grid, transportation or communication systems, social and economic organizations (like cities), an ecosystem, a living cell, and ultimately the entire universe.

System Dynamics and Discrete Event Simulation. The modeling techniques used by system dynamics and discrete event simulations are often different at two levels: The modeler way of representing systems might be different, the underlying simulators' algorithms are also different. Each technique is well tuned to the purpose it is intended.

He suggested the conceptual solution of the three body problem, which emerges in the interplay of Earth, Moon, and Sun (1754). He was the first to construct a detailed evolutionary cosmology (1755). His ideas on biospherical dynamics allowed him to predict the rhythms of the monsoon and the oscillation of coastal winds (1755-1757).

Figure 12: The evolution of a signalling system under the replicator dynamics. When the number of states of the world, the number of signals, and the number of actions increase from 2, the situation rapidly becomes much more complex. If there are N states of the world, N signals, and N actions, the total number of possible strategies equals N^{2N} .
