A steam car burned fuel that heated water in a boiler. This process made steam that expanded and pushed pistons, which turned a crankshaft. An electric car had a battery that powered a small electric motor, which turned a drive shaft. A gasoline car ignited fuel that caused a small explosion inside each cylinder.

A steam boiler running on gas, meanwhile, would have a minimum of 80%. Hot water boilers have a minimum of 82% for gas models and 84% for models that run on oil. Energy.gov says boiler vs. furnace energy efficiency can also be compared by noting certain equipment features.

Boiler vs. Furnace Energy Efficiency | Constellation
The D slide valve, or more specifically Long D slide valve, is a form of slide valve, invented by William Murdoch and patented in 1799. It is named after the hollow central D-sectioned piston. This valve worked by "connecting the upper and lower valves so as to be worked by one rod or spindle, and in making the stem or tube which connects them hollow, so as to serve for an induction pipe to the u

Slide valve - Wikipedia
These early systems powered cars by burning fuel that heated water in a boiler, creating steam that expanded and pushed pistons that turned the crankshaft, which then turned the wheels. However, the problem was that steam engines added so much weight to a vehicle that they proved a poor design for road vehicles.

Who Invented the Steam Car?
In order to model it I need to know how it works so I did a simple graphic of what I thought how it worked down in the bottom is the fire box because that is where the doors are located. hot gas and smoke pass through the inner pipes the out. the boiler itself is filled with water that turns to steam and rises into the steam dome.
